

Lasso Regression

 L1 regularization adds a penalty equal to the absolute value of the magnitude of coefficients.

$$\sum_{i=1}^{n} \left(y_i - \beta_0 - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 + \lambda \sum_{j=1}^{p} |\beta_j| = RSS + \left| \lambda \sum_{j=1}^{p} |\beta_j| \right|$$

- L1 regularization adds a penalty equal to the absolute value of the magnitude of coefficients.
 - Limits the size of the coefficients.
 - Can yield sparse models where some coefficients can become zero.

- LASSO can force some of the coefficient estimates to be exactly equal to zero when the tuning parameter λ is sufficiently large.
- Similar to subset selection, the LASSO performs variable selection.
- Models generated from the LASSO are generally much easier to interpret.

- LassoCV with sklearn operates on checking a number of alphas within a range, instead of providing the alphas directly.
- Let's explore the results of LASSO in Python and Scikit-Learn!

03-Regularization-Ridge-Lasso-ElasticNet[LECs8-9].ipynb

L1 and L2 Regularization

- We've been able to perform Ridge and Lasso regression.
- We know Lasso is able to shrink coefficients to zero, but we haven't taken a deeper dive into how or why that is.
- This ability becomes more clear when learning about elastic net which combines Lasso and Ridge together!

- Let's dive a little deeper into Lasso.
- Lasso was originally introduced in geophysics literature in 1986 by Symes and Santosa.
- It was later independently rediscovered and popularized in 1996 by Robert Tibshirani who coined the term "Lasso".

 Does the name Robert Tibshirani sound familiar?

 Robert Tibshirani is one of the authors of ISLR!

 All the authors have a history of very impressive accomplishments!

We can rewrite Lasso and Ridge:

minimize
$$\left\{ \sum_{i=1}^{n} \left(y_i - \beta_0 - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 \right\} \quad \text{subject to} \quad \sum_{j=1}^{p} |\beta_j| \le s$$

and

$$\min_{\beta} \left\{ \sum_{i=1}^{n} \left(y_i - \beta_0 - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 \right\} \quad \text{subject to} \quad \sum_{j=1}^{p} \beta_j^2 \le s,$$

 There is some sum s which allows to rewrite the penalty as a requirement:

minimize
$$\left\{ \sum_{i=1}^{n} \left(y_i - \beta_0 - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 \right\} \quad \text{subject to} \quad \sum_{j=1}^{p} |\beta_j| \le s$$

and

$$\min_{\beta} \left\{ \sum_{i=1}^{n} \left(y_i - \beta_0 - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 \right\} \quad \text{subject to} \quad \sum_{j=1}^{p} \beta_j^2 \le s,$$

There is some sum s which allows to rewrite the penalty as a requirement:

minimize
$$\left\{ \sum_{i=1}^{n} \left(y_i - \beta_0 - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 \right\}$$
 subject to
$$\sum_{j=1}^{p} |\beta_j| \le s$$

and

minimize
$$\left\{ \sum_{i=1}^{n} \left(y_i - \beta_0 - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 \right\} \quad \text{subject to} \quad \sum_{j=1}^{p} \beta_j^2 \le s,$$

- Start with a simple thought experiment:
 - A simple equation:

$$\circ \hat{\mathbf{y}} = \beta_1 \mathbf{x}_1 + \beta_2 \mathbf{x}_2$$

 We know that regularization can be expressed as an additional requirement that RSS is subject to.

- Start with a simple thought experiment:
 - A simple equation:
 - $\circ \hat{\mathbf{y}} = \beta_1 \mathbf{x}_1 + \beta_2 \mathbf{x}_2$
 - L1 constrains the sum of absolute values.
 - $\circ \sum |\beta|$
 - L2 constrains the sum of squared values.
 - $\circ \sum \beta^2$

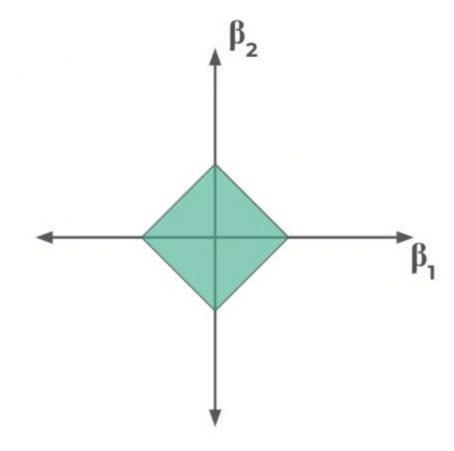

- Start with a simple thought experiment:
 - A simple equation:
 - $\circ \hat{\mathbf{y}} = \beta_1 \mathbf{x}_1 + \beta_2 \mathbf{x}_2$
 - There is some sum s that the penalty is less than.

- For the case of only two features:
 - $\circ \hat{\mathbf{y}} = \beta_1 \mathbf{x}_1 + \beta_2 \mathbf{x}_2$
- Lasso Regression Penalty:
 - $\circ |\beta_1| + |\beta_2| \le s$
- Ridge Regression Penalty:
 - $\circ \beta_1^2 + \beta_2^2 \le s$

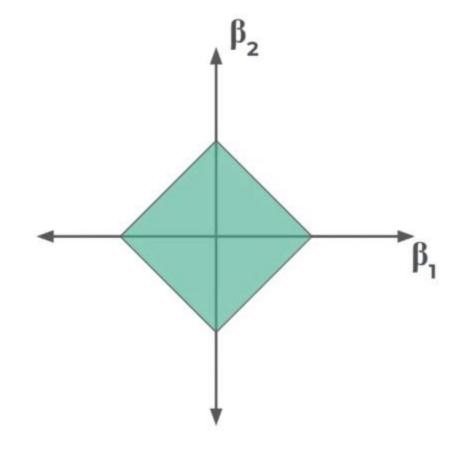

• Let's plot Lasso: $|\beta_1| + |\beta_2| \le s$

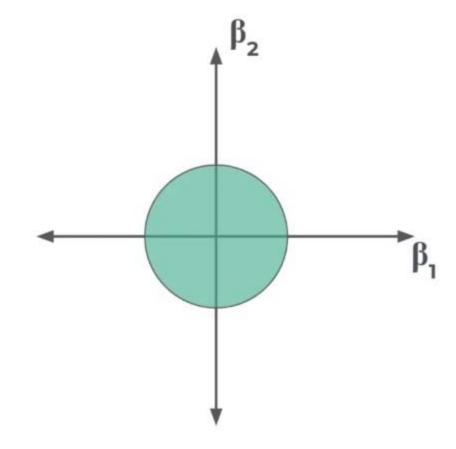

• Let's plot Lasso: $|\beta_1| + |\beta_2| \le s$

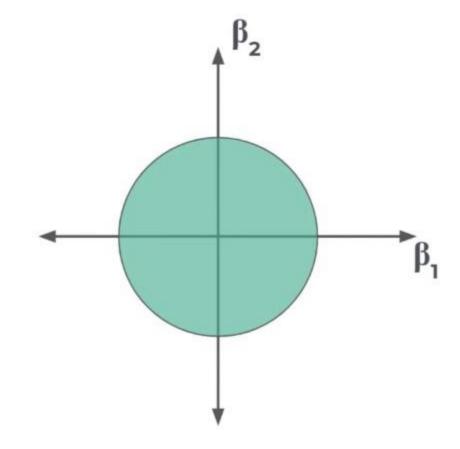

• Let's plot Ridge: $\beta_1^2 + \beta_2^2 \le s$

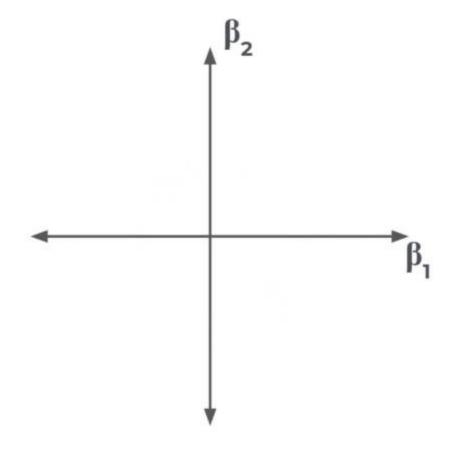

• Let's plot Ridge: $\beta_1^2 + \beta_2^2 \le s$

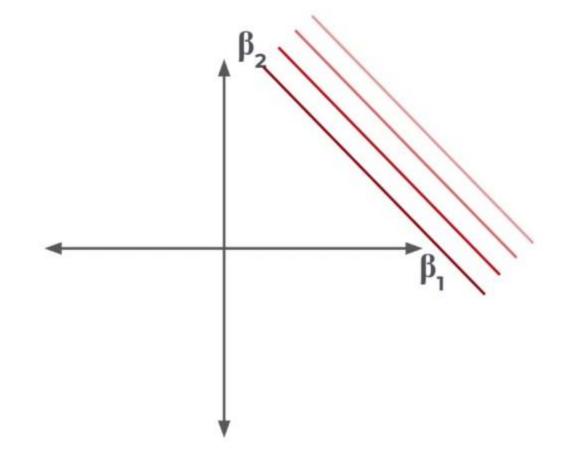

What would RSS look like?

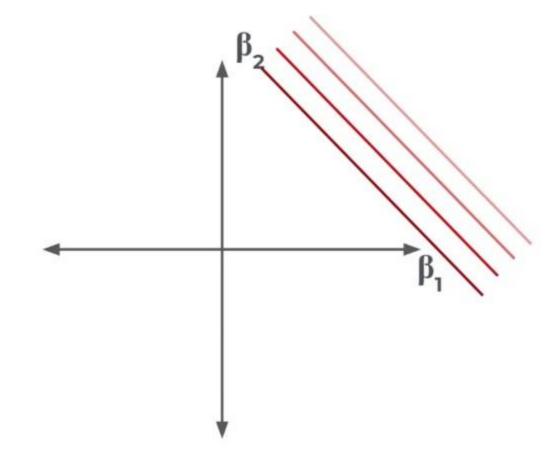

What would RSS look like?

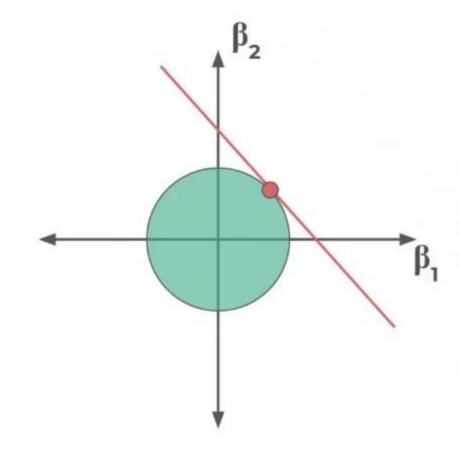

But were subject to the penalty!

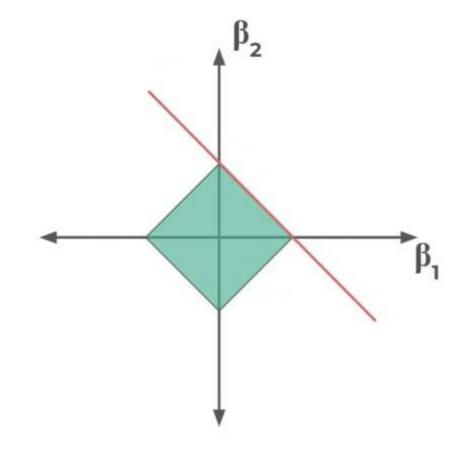

• Penalty for Ridge: $\beta_1^2 + \beta_2^2 \le s$

• Penalty for Lasso: $|\beta_1| + |\beta_2| \le s$

Lasso:

 A convex object that lies tangent to the boundary, is likely to encounter a corner of a hypercube, for which some components of β are identically zero.

Ridge: In the case of an n-sphere, the points on the boundary for which some of the components of β are zero are not distinguished from the others and the convex object is no more likely to contact a point at which some components of β are zero than one for which none of them are.

 Elastic Net seeks to improve on both L1 and L2 Regularization by combining them:

Error =
$$\sum_{i=1}^{n} \left(y_i - \beta_0 - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 + \lambda_1 \sum_{j=1}^{p} \beta_j^2 + \lambda_2 \sum_{j=1}^{p} |\beta_j|$$

 Here we seek to minimize RSS and both the squared and absolute value terms:

Error =
$$\sum_{i=1}^{n} \left(y_i - \beta_0 - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 + \lambda_1 \sum_{j=1}^{p} \beta_j^2 + \lambda_2 \sum_{j=1}^{p} |\beta_j|$$

 Notice there are two distinct lambda values for each penalty:

Error =
$$\sum_{i=1}^{n} \left(y_i - \beta_0 - \sum_{j=1}^{p} \beta_j x_{ij} \right)^2 + \lambda_1 \sum_{j=1}^{p} \beta_j^2 + \lambda_2 \sum_{j=1}^{p} |\beta_j|$$

 We can alternatively express this as a ratio between L1 and L2:

$$\frac{\sum_{i=1}^{n} (y_i - x_i^J \hat{\beta})^2}{2n} + \lambda \left(\frac{1 - \alpha}{2} \sum_{j=1}^{m} \hat{\beta}_j^2 + \alpha \sum_{j=1}^{m} |\hat{\beta}_j| \right)$$

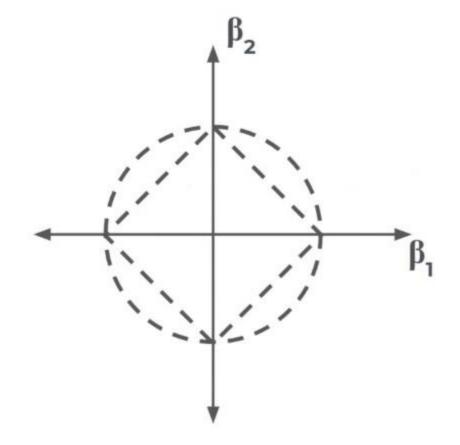

We can also use simplified notation:

$$\hat{eta} \equiv \operatorname*{argmin}_{eta} (\|y - Xeta\|^2 + \lambda_2 \|eta\|^2 + \lambda_1 \|eta\|_1)$$

Elastic Net Penalty Region:

 Let's explore how to perform Elastic Net with Python and Scikit-learn!

$$\frac{\sum_{i=1}^{n} (y_i - x_i^J \hat{\beta})^2}{2n} + \lambda \left(\frac{1 - \alpha}{2} \sum_{j=1}^{m} \hat{\beta}_j^2 + \alpha \sum_{j=1}^{m} |\hat{\beta}_j| \right)$$

Linear Regression Project Data Set

Project Data Set

- Most data sets require cleaning, analysis, and feature engineering before being used for machine learning.
- Let's quickly review the data set for the Linear Regression Project.
- In the next sections, we will focus on setting up the data for machine learning!
